

### **DAREDEVIL DRIVE-BI**

The Drive - Bi is a dual channel op amp gain circuit. Designed to cover medium to high level amp style drive that is extremely dynamic and raw.

Low channel adds grit, sustain, and overdrive to your amp while still pushing output.

Hi gain mode expands low end, saturation, and output compression for huge warm tones.

This is one of the most natural sounding gain pedals on the market. Great for solo boosts as well.

**VOLUME** - Controls effect output

**GAIN** - Amount of circuit drive

**HI / LOW** - Selects between both channels of gain

-True bypass, runs on 9V battery or DC supply

Use ONLY a negative ground (pin) power supply when using a DC adapter.

Warranty Info: Daredevil covers repair or replacement of this unit for 2 years should it malfunction unless the damage occurred from operator misuse including incorrect power supply, any adjustment to inner components, or physical incurred damage. International customers check with dealer for warranty policies, shipping is not covered for out of USA claims.
