

Your new...

ACE OCTAVE FUZZ

Tips and tricks:

- Use your Volume and Tone knobs on the guitar!
- Rolling *down* the volume knob a little and turning the tone knob *down* will make the octave pop more, especially on the neck pup.
- This pedal will like the NECK pickup on the guitar to really get fat tones.
- Chords do not work that well on octave fuzzes. You're going to get a lot of "clang and fart" going on. However, if you are after melted tones that sound like broken amps, then go for it!
- Plenty of noisy, "terrible" sounds when you want them!!!
- Putting a fuzz pedal in front of the Ace will get tons of cool sounds. The nice thing about the Ace, as opposed to other oct-up fuzzers, is that it will stack well with other fuzzers due to the fact that it is a "cleaner" oct up than some. The word "clean" sounds a bit silly with reference to this pedal, but in relation to some others, you could say that.
- I prefer this order:
Muff-type fuzz (Tall font, Tri, etc.) → Ace Fuzz → other pedals or amp
but there is no rule for this. Experiment!
