

The Good One™

Inspired by a particularly amazing vintage 1972 Big Muff® that came into the shop for repair, the Good One is a 100% reverse-engineered replica of that exact unit.

The “Triangle Knob” era Big Muffs have been known to have up to 18 different circuits within the same enclosure-style during inconsistent early years at EH in NYC. Some of these circuits sounded glorious, some, not so great. Once the much needed repairs were complete, and after the first strum of a chord blasting through the pedal, all in the shop immediately knew, that it was indeed, one of the GOOD ONE’s.

With its ceramic capacitors, odd component values, and carbon composition resistors, the insides did not look pretty, but the tone was beautiful.

The Good One pays homage to this pedal in every way possible.

Features:

- Period correct carbon composition resistors
- NOS ceramic disc capacitors
- Hand selected transistor sets
- Heavy duty vintage style folded steel enclosures

The Controls:

VOLUME Makes it louder or not so loud when ya turn it.

TONE Controls the sweep of the passie mid-notch

SUSTAIN Controls how much gain is let into the circuit

Other Info:

CURRENT DRAW The Good One will draw around 5.5mA

POWER Requires a center-**negative** 2.1mm barrel regulated power supply (typical guitar pedal power unit). Please use a supply intended for effects pedals.
May also be operated with a 9V battery

BYPASS Effect on/off switching is done via a 100% mechanical 3PDT foot-switch, otherwise known as “true- bypass”
