

Hey buddy! Thanks for picking up our all-new Organizer! The Organizer is a polyphonic organ emulator designed to mimic the organ tones of yesteryear crossed with the highly unique "Guitorgan". The organizer has a warm and very analog feel with a hint of Leslie warble that is unlike other modern octave shifters. It tracks all over the neck on both guitar and bass and will transpose single notes as well as chords. The Organizer uses a mix of analog and DSP circuitry with true bypass switching and an all analog direct (dry) signal path.

Controls

Up: Level control for the octave up.

Down: Level control for the octave down.

Choir: This control takes a mix of the octave up and octave down setting and regenerates it. The end result is an additional 2 octaves up, 2 octaves down and direct signal with a slight delay that adds a "church organ" like feel. This control only works if the octave up and octave down are in use.

Direct: Level control for the analog dry signal.

Tone: Low pass filter for the wet signal, counter clockwise rolls off the high end.

Lag: Delay control for the wet signal. Full counter clockwise is minimal delay, delay time increases as it rotates clockwise.

Power

A standard 9 volt DC power supply intended for musical instruments with a negative center 2.1mm barrel. No battery option.

This device works best after all dirt and other gain related pedals.

Hand made one at a time by a bunch of human beans in the beach community of Akron, Ohio.
